

# MONTANE DRIVE NATURAL GAS PROJECT

## Overview

We will replace approximately 550 feet of natural gas line and pressure test 1,500 feet of existing natural gas line south of and adjacent to Montane Drive and east of Soda Creek Road in Idaho Springs, Colorado. This maintenance project allows us to continue to provide safe, reliable natural gas service and enhances system resiliency during extreme weather.

## Schedule

Construction will start as early as July 2023 and is expected to continue through Winter 2023. Restoration will be completed by Spring 2024.

Schedules are subject to change.

## Construction

Access to the Montane Park subdivision via Montane Drive will be maintained.

During work, you may notice:

- Marking of utility lines and utility survey holes.
- Road and sidewalk closures.
- Traffic control with traffic flaggers.
- Temporary changes to access.
- Construction noise.

We will install the natural gas line by open trenching which involves digging a trench and placing the natural gas line in the trench.

We restore work areas to preconstruction conditions as weather allows. Work areas may be left temporarily restored after construction until we can complete final restoration.

This map is a graphic and may not show exact locations.

**MONTANE DRIVE NATURAL GAS PROJECT****Safety overview**

Public safety is at the foundation of all we do. The safety of the public around our natural gas system influences every decision we make. We take a proactive approach to public safety by implementing safety measures before, during and after construction.

The project has been designed to meet federal and state standards and safety requirements for installing, maintaining and operating natural gas infrastructure.

**Learn to recognize a natural gas leak**

If you ever suspect a natural gas leak, leave your home or business immediately. Once safely away, call **911**, then Xcel Energy at **800-895-2999**.

It is important to know how to recognize potentially dangerous natural gas leaks, so use your senses. Signs of a natural gas leak include:

- A “rotten egg” or sulfur-like odor, though it may smell differently to you.
- Hissing, whistling or roaring sounds outside near the natural gas line or inside near an appliance.
- Dirt spraying into the air or continuous bubbling in a pond or creek.
- Unexplained dead or dying vegetation.

**Call before you dig**

A common cause of natural gas incidents results from improper or unauthorized digging near underground utilities. Prior to digging, call **811** or visit [colorado811.org](https://colorado811.org) to have buried utility lines located and marked. This helps prevent dangerous conditions that result from damaging a buried line.

**Natural gas construction safety****During construction and installation of the natural gas line, we:**

- Implement a corrosion prevention system designed to eliminate metal loss.
- Verify pipe welds using an independent third party.

**Once the line has been installed and prior to putting it into service, we:**

- Internally inspect the line.
- Perform internal pressure tests to verify the line’s integrity.

**During the lifetime of the natural gas line, we:**

- Conduct annual hazard patrols and leak surveys and regularly inspect the line.
- Monitor (24/7) the line and other infrastructure through our staffed gas control center.
